Adding a new shopping cart was a fun experience and reminded me of the beginning of the project with lo to hi-fi prototyping. One of the challenges that I encountered was using javascript to enable some functionality onto the site; I initially had a lot of trouble with getting the images to change when a different color option was selected. I didn't implement any visible changes for size, because I had noticed that many existing e-commerce websites didn't have reflections for changes in size. Something else that I had trouble with was positioning the indicator for the number of items in the cart. Initially, it sat above the heading no matter what I did to try to change it, then pushed the other elements in the heading around rather than sit on top of the shopping cart. After a bit of experimentation and debugging however, I was able to figure it out. I am also currently working on making the number of items in the cart a site wide change, rather than limited to only one instance of a page.
